

Create a Dataverse table for the machine ordering app

Build the shared data foundation for machine orders, business logic, and connected app experiences.

APP IN A DAY

Move the machine app into Dataverse

Replace temporary app data with a scalable data model that can support both the canvas app and later back-office experiences.

- Starting point**
The machine ordering canvas app from the previous module.
- New foundation**
A custom Dataverse table for machine-order records.
- Connected experience**
A form in the canvas app writes directly to the table.
- What comes next**
The same data will support a model-driven app for processing orders.

What will you build?

A custom table, a data-entry form, derived values, and server-side rules for the machine-ordering solution.

- Create the table**
Define the business record that Dataverse will store.
- Add columns**
Capture the fields required for each machine order.
- Populate data**
Use a Power Apps form control to create records.
- Add data logic**
Create a calculated column and a business rule.

Tables, rows, and columns

A Dataverse table describes one business concept; each row is a record and each column stores one attribute.

Table

The collection of machine-order records.

Row

One submitted machine order.

Column

One piece of data such as machine, quantity, or location.

Data type

The rule that determines what a column can store.

Metadata

The structure that applications use to understand the data.

Use a form to create records

The canvas app becomes a data-entry experience that validates input and submits an order to Dataverse.

Connect the table

Add the new Dataverse table as an app data source.

Configure the form

Choose the fields users need to complete.

Submit the record

Use the form control to write the order.

Confirm the result

Verify that the submitted row appears in Dataverse.

See what Dataverse stores

The table data view lets you inspect the records created through the app and verify that values were saved correctly.

Inspect rows

See each submitted machine order as a record.

Review columns

Check the values captured by the form.

Edit test data

Correct or add records while developing the solution.

Validate the connection

Confirm that app actions are reaching the intended table.

Create a calculated column

A calculated column derives a value from other data so the result is consistent wherever the table is used.

Use existing values

Base the calculation on columns already stored in the row.

Define the expression

Describe how Dataverse should derive the result.

Centralize logic

Keep the calculation with the data instead of one app screen.

Reuse the result

Expose the calculated value to multiple app experiences.

Apply a server-side business rule

A business rule enforces data behavior in Dataverse so the logic is not limited to a single app interface.

Evaluate conditions

Check the values on the machine-order record.

Apply an action

Set or require values when the condition is met.

Run with the data

Enforce the rule as records are processed.

Support consistency

Apply shared logic across experiences that use the table.

One data model, multiple experiences

The canvas app now writes to a structured platform that can support calculations, rules, and the next model-driven app.

- Structured records**
Machine orders follow a defined table and column schema.
- Working submission**
The canvas form creates rows in Dataverse.
- Shared logic**
Calculated values and business rules live with the data.
- Ready for operations**
Back-office users can work with the same records next.

Before you begin

Confirm that the previous app and the correct Power Apps environment are available before creating the Dataverse table.

Complete earlier modules

This module is designed to follow the workshop sequence.

Open the correct environment

Create the table where the workshop solution is being built.

Keep the canvas app available

You will connect the existing app to the new table.

Test as you build

Verify the table, form submission, calculation, and rule in order.

Open the Dataverse lab and continue the solution.

Lab

- Create a Dataverse table for the machine ordering app
 - Estimated time: 1 hr 33 min
 - <https://learn.microsoft.com/en-us/training/modules/dataverse-lab-manual-online-workshop/>

Open the lab and build along with the instructor.

Lab Notes – Unit 3 of 7

- Section 2, Steps 3 and 6
 - "Select the searchable option" means "Enabled for Advanced find"

Open the lab and build along with the instructor.

Lab Notes – Unit 4 of 7

- Section 2, Steps 7
 - Select "10 Selected" rather than "Edit fields"

The screenshot shows the 'Properties' pane for a form named 'Form1'. The 'Display' tab is selected. Under the 'Fields' property, the value '10 selected' is chosen and highlighted with a red rectangle. Other visible properties include 'Data source' (Machine Order...), 'Views' (None), 'Snap to columns' (On), 'Columns' (3), 'Layout' (Vertical), 'Default mode' (Edit), 'Visible' (On), 'Position' (X: 40, Y: 40), and 'Size' (Width: 800, Height: 500).

Open the lab and build along with the instructor.

Lab Notes – Unit 5 of 7

- Exercise – Building apps with Copilot
 - Independent of other lab parts
 - Not necessary for succeeding labs
- Treat as optional

Open the lab and build along with the instructor.

Lab Notes – Unit 5 of 7

- Section 1, Steps 1 and 2 – UI change
 - Click on "Apps" on the left navigation bar. Then click "+ New App"->"Start with Copilot"

Open the lab and build along with the instructor.

Lab Notes – Unit 5 of 7

- Section 1, Step 4
 - Ignore this step
 - Window is no longer displayed

Open the lab and build along with the instructor.

Good data makes great apps—let's review yours

Double check the tables and relationships created based on your prompt. Does everything look right? Do you want to add more or make adjustments? When you're done, select Save and open app.

Got it
