Process machine requests after submission

Employees have placed their orders. Now back-office staff need an application for procurement, setup, and distribution.

- Starting point**
Machine requests are already stored in Dataverse.
- Operational need**
Staff must review and fulfill each request.
- New experience**
A model-driven app organizes records and process work.
- Process guidance**
A business process flow keeps fulfillment on track.

What will you build?

A standalone model-driven app that helps back-office staff manage machine requests through a guided process.

- Create the app**
Build a standalone model-driven application.
- Use Dataverse**
Base the experience on the existing machine-order data.
- Customize forms**
Present the fields staff need to do the work.
- Guide the process**
Add a business process flow for request fulfillment.

Canvas and model-driven apps working together

The canvas app optimizes the employee ordering experience; the model-driven app optimizes data-centric operational work.

- Canvas app**
Employees browse machines and submit requests.
- Dataverse**
Both applications work with the same business records.
- Model-driven app**
Staff review, process, and fulfill requests.
- One solution**
Each app style serves a different audience and task.

Data shapes the experience

Model-driven apps assemble navigation and record experiences from Dataverse tables and app components.

Navigation

Expose the business areas and tables staff need.

Views

Present lists of records for different work queues.

Forms

Display and update a complete machine request.

Dataverse

Provide the tables and metadata that drive the app.

Customize the machine-request form

Organize the record so operational staff can see and update the information needed at each stage.

Choose fields

Include the request and fulfillment information staff need.

Organize content

Group related information into tabs and sections.

Support updates

Make the record practical for procurement and setup work.

Test the form

Confirm that the record experience fits the process.

Views organize operational work

Views present selected columns and records so staff can focus on the requests relevant to the current task.

- Scan records**
Review multiple machine requests at once.
- Use meaningful columns**
Surface status and other fields needed for decisions.
- Switch perspectives**
Move among record lists designed for different needs.
- Open the detail**
Select a record and continue work in its form.

Add a business process flow

A business process flow shows the current stage and guides staff through the steps required to fulfill a request.

- Define stages**
Represent the major phases of fulfillment.
- Add steps**
Identify the information needed during each stage.
- Guide progress**
Make the current position in the process visible.
- Support consistency**
Help staff follow the same process for every request.

From request to fulfillment

The solution now connects the employee ordering experience to a structured back-office fulfillment process.

Submit

An employee requests a machine in the canvas app.

Store

Dataverse holds the shared request record.

Process

Staff work the request in the model-driven app.

Fulfill

The guided process supports procurement, setup, and distribution.

Before you begin

Confirm that the earlier workshop modules are complete and the machine-request table is available in the correct environment.

Follow the sequence

Microsoft recommends completing the workshop modules in order.

Use the correct environment

Build the app where the Dataverse table was created.

Verify the data

Make sure machine requests are available for the app.

Test progressively

Run the app after configuring its components and process.

Open the integration lab and complete the workflow.

Checklist:

- Environment ready
- Dataverse tables created
- Model-driven app configured
- Forms and views customized
- Business process flow added

Launch app

Stack: Power Apps, Dataverse, Power Automate, Microsoft 365

Mug: Build Automate Deliver

Lab

- Create a model-driven Power Apps app for machine ordering
 - Estimated time: 1 hr 20 min
 - <https://learn.microsoft.com/en-us/training/modules/power-apps-model-driven-apps-online-workshop/>

Open the lab and build along with the instructor.

Lab Notes – Unit 3 of 7

- Section 1, Step 12
 - Drag **Stage** to the canvas, ***making sure to drop it on the +*** to the right of the **Machine Requested** stage.

Lab Notes – Unit 3 of 7

- Section 1, Step 14
 - Select the **Details** *drop-down within the Place Order stage*

Lab Notes – Unit 4 of 7

- Section 1, Step 4
 - Select *the ellipsis (...)* to the right of the **Information Main** form
 - Hover over the arrow to the right of **Edit** but do NOT click yet
 - Select **Edit in new tab**
 - Then click

Open the lab and build along with the instructor.

Lab Notes – Unit 5 of 7

- Visualize data in a view with Copilot
 - Must enable two admin settings before proceeding with steps
 - *Natural language grid and view search*
 - Enable this feature for:
 - » *All users immediately*
 - *Allow AI to generate charts to visualize the data in a view*
 - Select *On*
 - Click *Save*
 - Lab manual directions are too vague and incomplete
 - Missing steps on how to find the settings
 - Only specifies changing one of the two required settings

Lab Notes – Unit 5 of 7

- Navigate to the *Power Platform admin center*
 - <https://admin.powerplatform.microsoft.com/home>
 - Select *Manage* on the left
 - Select environment

Open the lab and build along with the instructor.

Lab Notes – Unit 5 of 7

- Select *Settings*

Lab Notes – Unit 5 of 7

- Expand *Product* and select *Features*

Open the lab and follow along with it

Lab Notes – Unit 5 of 7

- Scroll down to *Natural language grid and view search*
