

POWER APPS | POWER AUTOMATE LAB

Integrate a Power Apps app with Power Automate

Automate machine-order approvals with Dataverse and Power Automate.

APP IN A DAY

Turn a submitted order into an approval

A new machine-order row starts a workflow that requests a decision and continues based on the approver's response.

- Starting event**
A new row is created in Microsoft Dataverse.
- Approval request**
Power Automate sends the request to the selected approver.
- Human decision**
The approver approves or rejects the machine order.
- Automated response**
The flow takes action based on the decision.

What will you build?

An automated cloud flow that connects a Dataverse machine order to a customized approval experience.

- Trigger the flow**
Start when a new Dataverse row is created.
- Create the approval**
Automate sending an approval request.
- Use order data**
Customize the request from the Dataverse row.
- Review approvals**
Use the Approval center to track work.

Trigger, wait, and respond

The flow begins with data, pauses for a human decision, then follows the appropriate outcome path.

- Trigger**
Detect the newly created machine-order row.
- Prepare context**
Read values from the triggering record.
- Start and wait**
Send the approval and wait for the response.
- Branch**
Choose the next actions from the approval outcome.

Start from a new Dataverse row

The machine-order table becomes the event source for the approval workflow.

- Choose the environment**
Use the environment containing the application data.
- Select the table**
Monitor the machine-order table.
- Create a record**
Submitting through the app adds the row.
- Start automatically**
The new row activates the cloud flow.

Build the request from order data

Dynamic values from the machine-order row give the approver the information needed to make a decision.

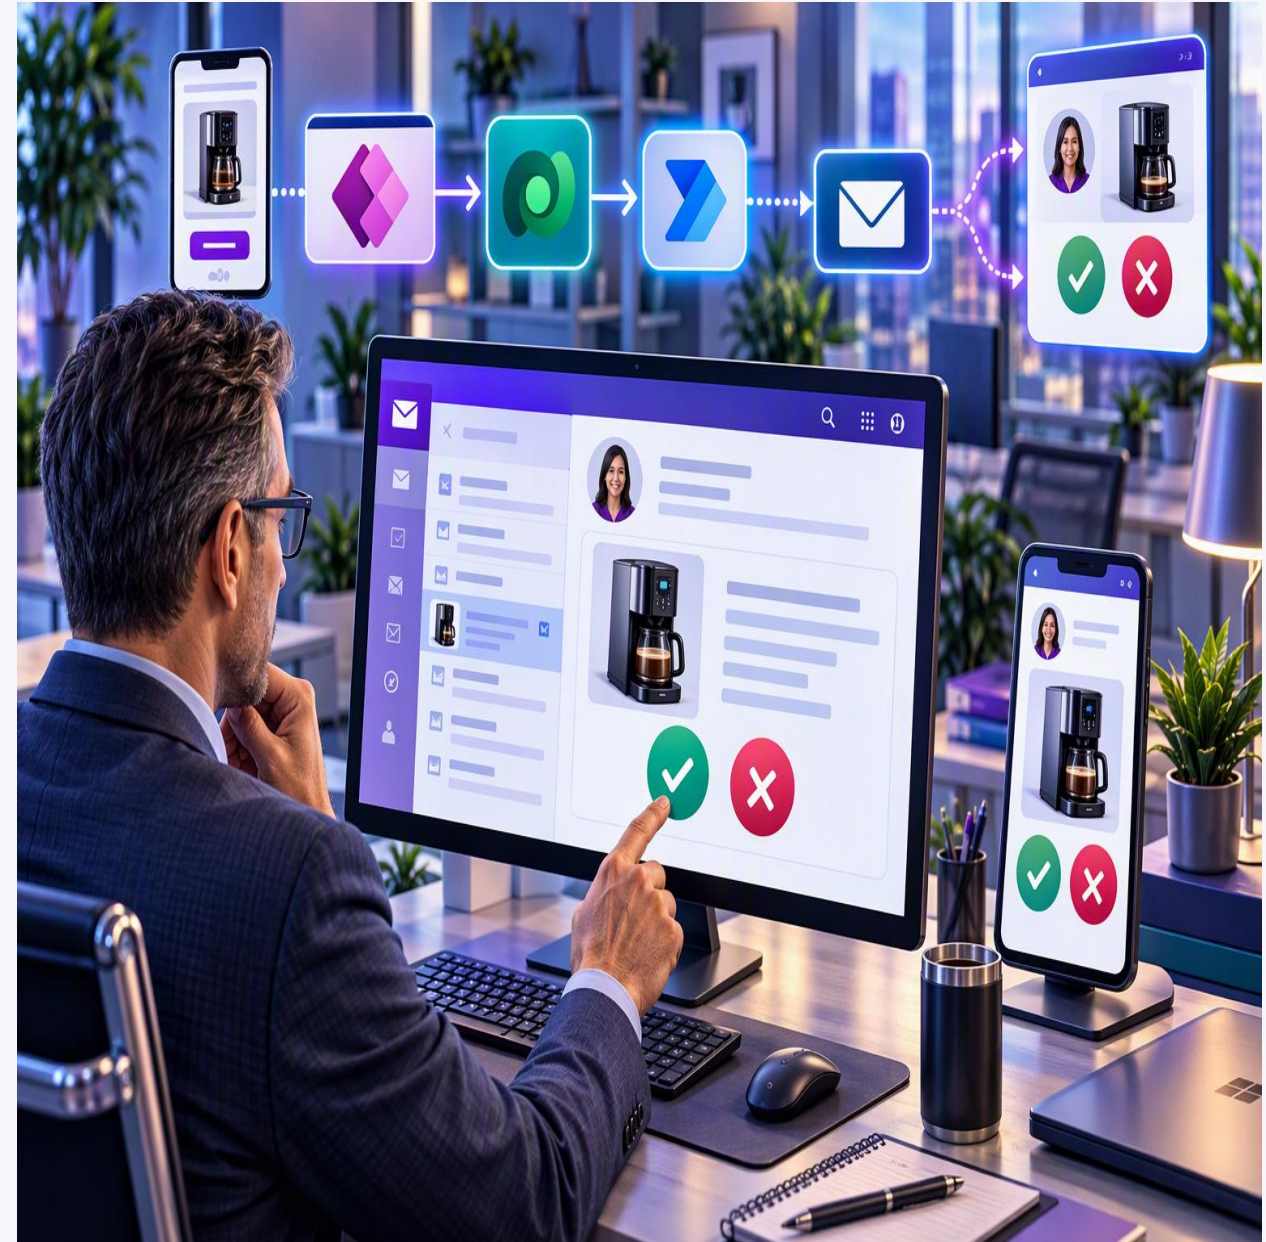

- Select the approver**
Route the request to the chosen recipient.
- Use dynamic content**
Insert values from the Dataverse row.
- Provide context**
Describe what is being requested.
- Make it actionable**
Present the approval as a clear decision.

Approve or reject from the request

The Modern Approvals service delivers the request, and the selected approver provides the response that resumes the flow.

- Receive the request**
The module states that an email is sent to the approver.
- Review the details**
The approver evaluates the machine order.
- Select an outcome**
Approve or reject the request.
- Resume the flow**
Power Automate continues after the response.

Take action based on the response

A condition separates approved and rejected requests so each outcome can receive the correct follow-up.

Evaluate the response

Read the approval outcome returned to the flow.

Approved path

Run the actions intended for an approved request.

Rejected path

Run the actions intended for a rejected request.

Continue the process

Use the outcome to drive the next business action.

Track approval work in one place

The Approval center provides a dedicated place to review approval requests and their state.

See assigned requests

Review approval work associated with the user.

Open the request

Inspect the approval and its details.

Respond when needed

Complete the assigned decision.

Review progress

Return to the center to monitor approval activity.

Apps, data, process, and people

The final workflow connects the employee request, shared Dataverse data, approval decision, and operational fulfillment.

Experience

The canvas app captures the employee request.

Data

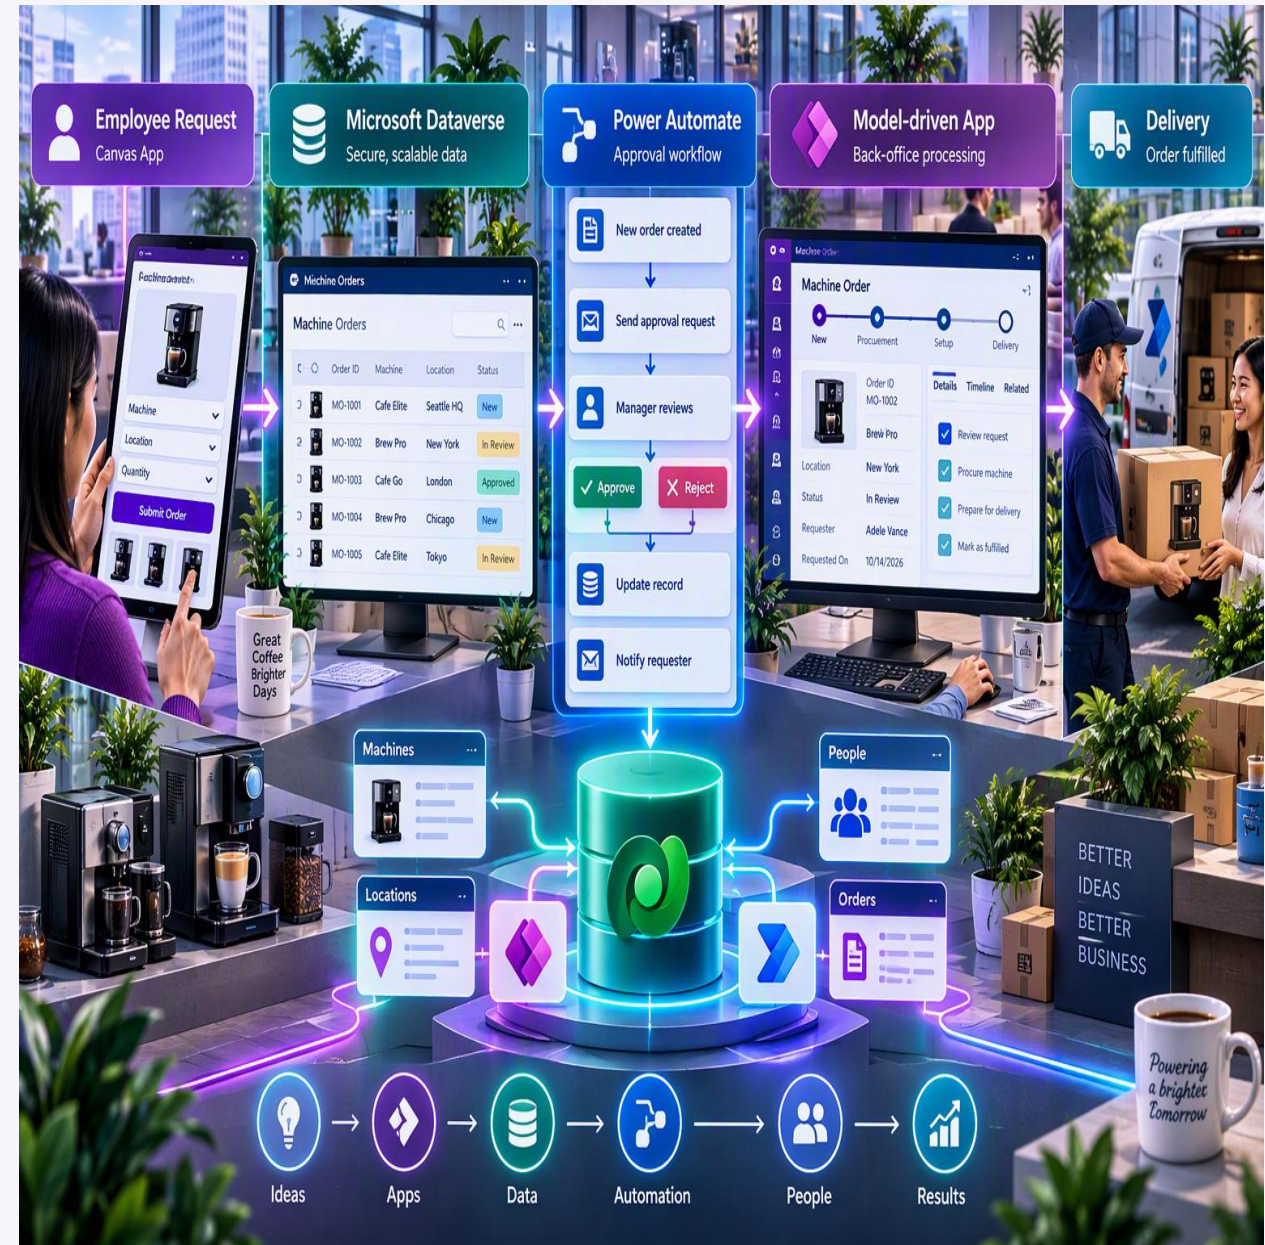

Dataverse stores the machine-order row.

Automation

Power Automate sends and processes the approval.

Operations

The model-driven app supports back-office fulfillment.

Before you begin

Confirm the existing app, its two required screens, the Dataverse data, and the correct environment before creating the flow.

Follow the sequence

Microsoft recommends completing the workshop modules in order.

Verify the app

The module requires an app with two existing screens.

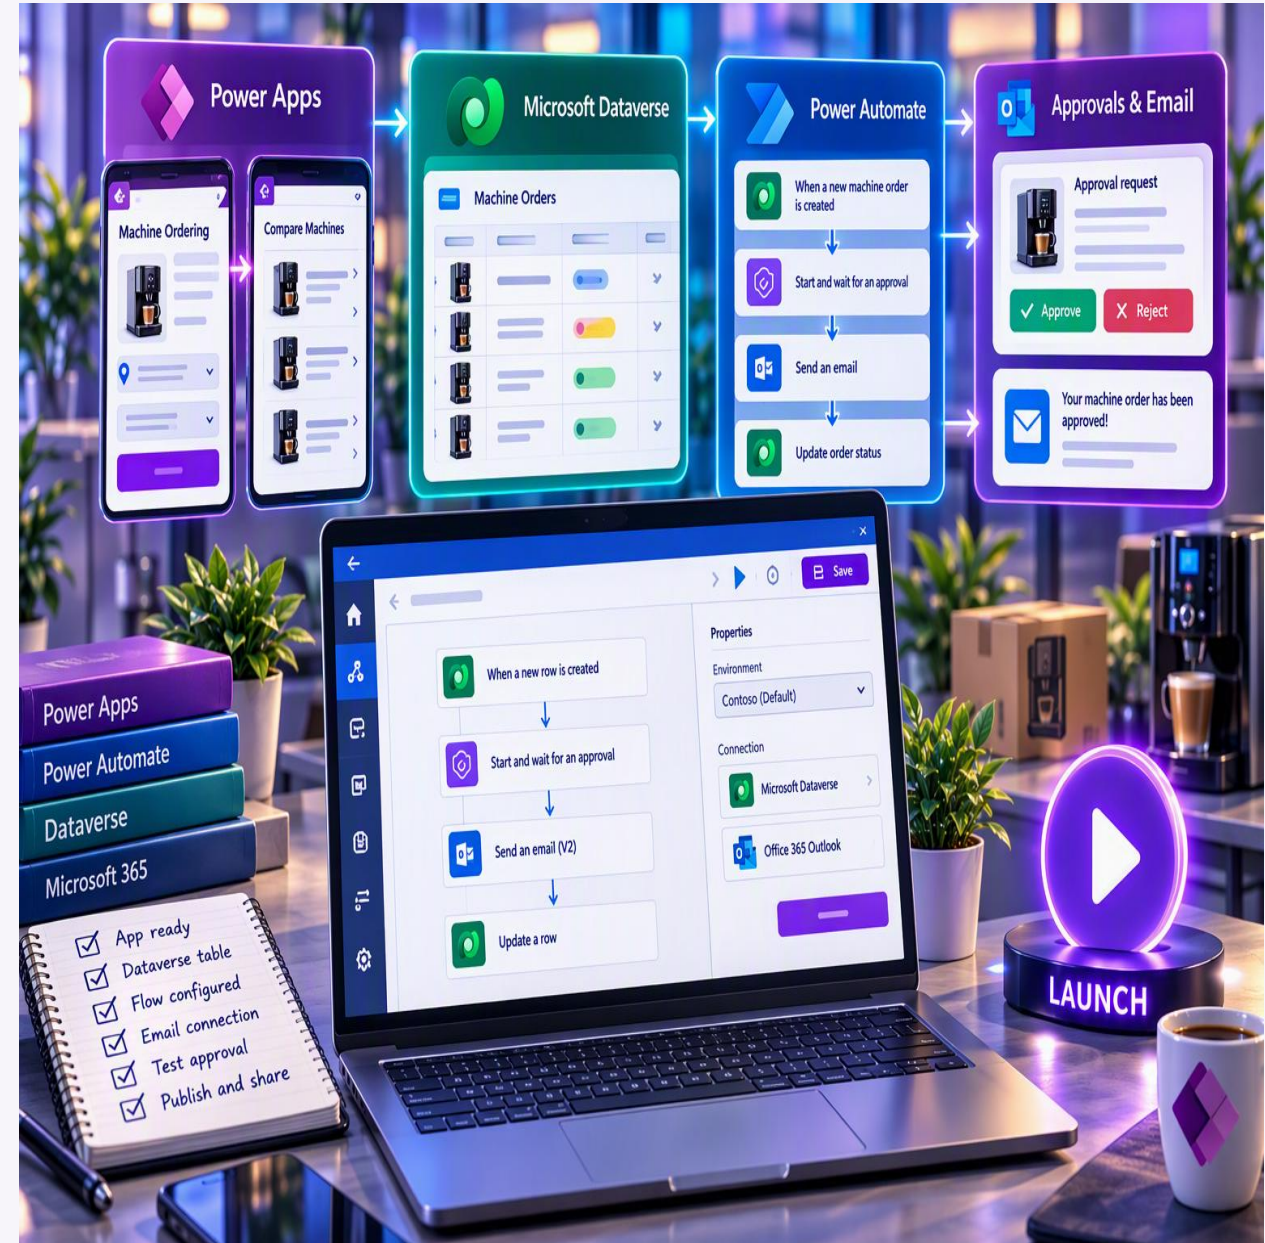

Use the correct environment

Create the flow where the Dataverse table is available.

Prepare a test

Use a new machine order to test the approval end to end.

Open the integration lab and complete the workflow.

Lab

- Integrate a Power Apps app with Power Automate
 - Estimated time: 1 hr 17 min
 - <https://learn.microsoft.com/en-us/training/modules/integrate-power-apps-online-workshop/>

Open the lab and build along with the instructor.
